Peanut Oil

Peanut oil, also known by other names such as groundnut oil and arachis oil, is a type of vegetable oil commonly used in cooking that is derived from peanuts. It comes in a number of varieties, including refined, unrefined, roasted, and cold-pressed, which have slight differences in their nutritional value and health benefits. Peanut oil is most commonly used in Asian cultures, including that of China and Southeast Asian nations like Vietnam, Laos, and Cambodia. The health benefits of peanut oil include skin care, lower cholesterol levels, improved heart health, and nervous system.

Last year, India had exported about 10,000 tonnes of groundnut oil in consumer packages. According to the Solvent Extractors Association of India (SEA), the country produces about 300,000-350,000 tonnes every year, and has potential to export about 40,000-50,000 tonnes in bulk. China is the biggest market for Indian groundnut oil. Thus, due to demand it is best to invest in this project.

Cross-Linked Sodium Carboxymethyl Cellulose

Cross-linked sodium carboxymethyl cellulose is also known as croscarmellose sodium or modified cellulose gum. Crosslinked sodium carboxymethylcellulose (CMC), croscarmellose, is prepared by the reaction of Na-CMC with acids. The raw material is usually a high viscosity sodium CMC with a low degree of substitution. The cross-linking reduces water solubility while still allowing the material to swell (like a sponge) and absorb many times its weight in water. As a result, it provides superior drug dissolution and disintegration characteristics. Cross-linked sodium carboxymethyl cellulose is used in tablets of table-top sweeteners and dietary food supplements,

as it facilitates disintegration in aqueous solutions, with a maximum level of use of 30 g/kg.

The global carboxymethyl cellulose (CMC) market was estimated at \$1,151.7 Million in 2014 and is projected to register a CAGR of 4.2% between 2015 and 2020. Carboxymethyl cellulose (CMC) or cellulose gum is a cellulose derivative with carboxymethyl group in its chain. CMC is physiologically inert, chemically stable, odorless and tasteless substance which safe for health and environment. The growth of processed food industry, increasing pharmaceutical and cosmetics production, and the growing oil drilling activities are the major factors driving the growth of CMC market. Calcium Gluconate

Calcium gluconate is the calcium salt of gluconic acid. In order for the product to be registered as a food fortificant, it must be prepared at high purity, i.e. without the presence of by-products that are unregistered. An important disadvantage of calcium gluconate is that it is relatively costly to produce. For the production of calcium gluconate an enzymatic process is preferred because of its high specificity and the resulting high purity of the product. However, the solubility of calcium gluconate under the conditions required for optimal enzymatic conversion (pH 5-7, 30-35°C.) is only 40 g/L. Calcium Gluconate can be used in Food, Beverage, Pharmaceutical, Health & Personal care products, Agriculture/Animal Feed/Poultry.

The international market for calcium gluconate can be divided largely on the basis of application, end use, in addition to the available form.

On the basis of the end use, the market for calcium gluconate may be additionally divided into bulking agent, emulsifier, and thickening agent. The global market for calcium gluconate is projected to grow as a result of the mounting demand from different end-use industries with the highest demand expected from pharmaceutical and food and beverages. The major global key players in this space include: Noah Technologies Corporation, Aaron Industries, Inc. AKZO Nobel Chemicals Inc, American Biorganics, Inc, Coyne Chemical, Alfa Aesar, PMP Fermentation Products, Inc and Glucona America, Inc. Hot Dip Galvanizing

Hot Dip Galvanizing is a process in which an adherent, protective coating of zinc and zinc compounds is developed on the surfaces of iron and steel products by immersing them in a bath of molten zinc. Hot dipping is a process in which a metal substrate is immersed in a molten bath of a second metal. After removal, the second metal is coated into the first. It is essential to have higher melting temperature of first metal than the second. The most common substrate metals are steel and iron and the common coating materials are zinc, aluminium, tin and lead. Prior to coating, cleaning of rust, scale, oil, paint and other surface contaminants is required. For coating process, immersion in the molten metal is done for periods ranging

from a fraction of a minute for small objects like fasteners to several minutes for large scale structures. Temperature of approximately 450°C and 700°C need to be maintained (bath temperature) for galvanizing (zinc coating) and aluminium coating respectively.

Steel manufacturing output of India is expected to increase from 88.4 million tons (MT) in 2017 to 128.6 MT by 2021, accelerating the country's share of global steel production from 5.4% in 2017 to 7.7% by 2021. India is the second-largest crude steel producer in the world. In FY17, India produced 111.254 million tons (MT) of finished steel. Total finished steel production in the country increased at a CAGR of 8.39 per cent over FY12-17. Crude Steel and Finished Steel production during April-October 2017 stood at 66.70 MT and 76.36 MT, respectively. Driven by rising infrastructure development and

growing demand for automobiles, steel consumption is expected to reach 104 MT by 2017. India's steel production is expected to increase from 97.42 MT in FY17 to 128.6 MT by 2021. Thus, due to demand it is best to invest in this project.

Grapes Packing for Exports with 100 MT Cold Storage

A grape is a fruit, botanically a berry, of the deciduous woody vines of the flowering plant genus Vitis. Grapes can be eaten fresh as table grapes or they can be used for making wine, jam, juice, jelly, grape seed extract, raisins, vinegar, and grapeseed oil. Table grapes are most often packaged in plastic punnets, such as clamshells. These punnets are then placed in a cardboard crate. The processes at the export packhouse include: receipt of raw material at packhouse; weighing and acceptance of produce; trimming, sorting and grading; weighing, packing and coding; pre-cooling; sulphur dioxide padding; palletization; storage (cold stores); container loading; and transportation.

Grapes account for 2.7 percent of production and 1.4 percent of total fruit area in India. India is a small producer of grapes, with a world share of less than 2 percent. Intravenous fluids are fluids which are intended to be administered to a patient intravenously, directly through the circulatory system. These fluids must be sterile to protect patients from injury, and there are a number of different types available for use.

Intravenous fluids can also be used as a route of medication administration. If a doctor wants to deliver a small amount of medication over an extended period of time, it can be dissolved in a bag of intravenous fluids and set on an infusion pump which delivers the medicated fluid directly into the blood.

Recovery of Lead

Lead is a material very easy to recycle and, provided that adequate procedures are implemented; the final product (secondary lead) is indistinguishable from the primary lead produced from ores. About 50% of the lead consumed worldwide is derived from recycled and reused materials. There are many different uses of Lead. It may be used as a pure metal, alloyed with other metals, or as chemical compounds. The recovery of metals from metal scrap has the advantage that it is easier and far less energy dependent than the production of primary lead from ores. The production of recycled lead requires 35-40% of the energy necessary to produce lead from ores. In addition, the recovery of lead decreases the lead dispersion in the environment and preserves the mineral reserves for the future. Recycling lead is relatively simple and in most of the

Saline and Dextrose Fluid (IV)

Saline is a general phrase referring to a sterile solution of sodium chloride in water, but is only sterile when it is to be placed parenterally; otherwise, a saline solution is a salt water solution. The sterile solution is typically used for intravenous infusion, rinsing contact lenses, nasal irrigation, and often used to clean a new piercing. Dextrose Solution (5%) is an isotonic solution and supplies calories to human body instantaneously without disturbing the electrolyte balance.

The global Intravenous (IV) solutions market was valued at USD 6.9 billion in 2015 and is projected to grow at a CAGR of 7.8% over the forecast period. And is expected to reach a value of USD 13.79 billion by 2024. As a whole there is a good scope for new entrepreneur to invest in this business.
