Manufacture of Value Added Products from Rice Husk (Hull) and Rice Husk Ash (RHA) (2nd Revised Edition)

₹ 1400/- US\$ 150-

Rice husk is the outermost layer of protection encasing a rice grain. Rice husk was largely considered a waste product that was often burned or dumped on landfills. Many ways are being thought for disposal of rice husk and only a small quantity of rice husk is used in agricultural field as a fertilizer, or as bedding and for stabilisation of soils. Therefore, the use of rice husk as rice husk ash is one of the most viable solution. The husk can be used for poultry farming, composting or burning. In the case of burning, it has been used as biomass to power reactors to generate thermal or electrical energy. India is a major rice producing country and the husk generated during milling is mostly used as a fuel in the boilers for processing paddy, producing energy through direct combustion and/or by gasification.

This handbook explains manufacturing process with flow diagrams of various value added products from rice husk & rice husk ash, photographs of plant & machinery with supplier's contact details and sample plant layout & process flow sheets. The major contents of the book are rice husk, rice husk ash (RHA), precipitated silica from rice husk ash, activated carbon from rice husk, cement from rice husk ash, electricity from rice husk, ethanol from rice husk, hardboard from rice husk, oxalic acid from rice husk, paper from rice husk, particle board from rice husk, rice husk briquettes, rice husk pellet, silicon from rice husk, sodium silicate from rice husk, packaging.

(Automobile, Industrial, Leather, Furniture,
Floor, Marine, Metal and Shoe Polish)

₹ 1675/- US\$ 150-

Polishes typically contain a lot of abrasives, rinsing agents and organic solvents. Protectants typically contain neither abrasives nor rinsing agents, less organic solvents than the two other product types and a lot of protectant. Polishes are used to maintain a glossy finish on surfaces as well as to prolong the useful lives of these surfaces. Polishes can be described in terms of their physical form, carrier system, ability to clean, and durability. Physical forms of polishes include pastes, pre-softened pastes (non-flowing emulsions), liquids, and gels. Polishes beautify and protect by coating or refinishing surfaces.

Waxes are used as finishes and coatings for wood products. Waxes are also used in shoe polishes, wood polishes, and automotive

polishes, as mold release agents in mold making. Furniture polish value sales are expected to reach US\$ 13,101.3 mn by 2027, expanding at a CAGR of 5.0%. Biomass Briquettes from Bio Waste

Among the non-conventional forms of energy, Bio-Energy offers vast potential under Indian conditions, due to the wide spectrum of BIOMASS available in different agro-climatic regions of the country.

Worldwide, the energy stored in biomass through photosynthesis is approximately 3×10^{21} J (90% in trees) every year, which is nearly 10 times the world's annual energy use. Even through the total renewable biomass resource for energy far exceeds the world's total energy requirement, its volume exploitation remains limited because of the present low cost of fossil fuels, the heterogeneous nature of biomass, and the area over which the biomass must be collected for large-scale applications.

Biomass feed, especially agro-residues, is available in different forms, such as husks, straw, and stalks of various and numerous crops. Due to this heterogeneous nature, the utility of these materials for energy becomes limited, and energy conversion processes tend to become biomass specific. Biomass briquettes are a proven way of generating energy from bio-waste. Different

Prestressed Concrete Sleepers

Concrete sleepers are one of the most important applications of a railway track system. The impact load characteristics and ultimate load carrying capacity of a prestressed sleeper, but the fatigue life of prestressed concrete sleepers is limited. The railway sleeper is a vital railway component that lies between the rail and the ballast. The important functions of sleepers include the following: uniform transfer and distribution of loads from the rail foot to ballast bed, provision of an anchorage for the fastening system, and the restraining of lateral, longitudinal, and vertical movement of the rails.

Prestressing is the process of applying a load to a structure deforming it so that it will with stand a work load more effectively or so that it will defect less. Prestressed concrete is that in which internal stresses are introduced to such a magnitude and distribution that the tensile stresses resulting from the service loads are encountered to a desired degree. The prestresses are commonly introduced by tensioning the tensions.

Indian railways is world's largest railway network. Railways in India consume at about 350 Million concrete sleepers. The demand of such sleepers including Private players is expected to double to nearly 700 million sleepers in next 2 years. The Indian Railways is among the world's largest rail networks. The Indian Railways network is spread over 115,000 km, with 12,617 passenger trains and 7,421 freight trains each day from 7,172 stations plying 23 million travelers and 3 million tones (MT) of freight daily. The rev-

enue generated by the Railways is expected to grow at 10 per cent in the fiscal year 2017-18. Foreign Direct Investment (FDI) inflows into Railways related components from April 2000 to March 2017 were US\$ 798.55 million. The market size is projected to grow from USD 104.03 Billion in 2017 to USD 138.96 Billion by 2022, at an estimated CAGR of 5.96%.

Ready to Eat Food (RTE)

Ready to Eat Foods (RTE) are convenience foods, enclosed in aluminium container or pouches that only need to be cut and heated before being served. Instant vegetables in retort pouches fall under this category and find application not only as home meal replacement in working class households but also in fast-food restaurants and multi cuisine food joints. These are handy meals for armed forces and paramilitary forces deployed in remote places. RTE food includes wide range of products viz. vegetarian/non-vegetarian, basic food/delectable desserts, south and north Indian items available from a specialty or multi cuisine restaurant & food joint only.

Ready To Eat, Shelf Stable, Retort Sterilized Foods are completely cooked foods packed in airtight containers, which could be preserved at room temperature for a long period of time without the necessity of freezing, cooling and drying. The thermally-processed retort pouch foods are waterproof, weatherproof and bug proof. The Shelf Life of Ready To Eat Foods is from 1 year to 5 years, depending on the type of packing materials and processing procedures.

India's Food Processing industry is one of the largest industries in the country—it is ranked fifth in terms of production, consumption, export and expected growth. The industry employs 1.6 million workers directly. Gypsum Plaster Board

Gypsum Plaster Boards are constructional sheets composed of consigned Gypsum with about 15% fibre. Its outstanding contributes are fire resistance, dimensional stability, easy workability and low cost fibres are added to provide crack resistance and for fire resistance water repellent chemicals may be added to the board core. Paper-coated gypsum board is made by method of adding small amount of additives and reinforced fiber to plaster as the base material and coating the surface and back of plasterboard with paper.

Gypsum plaster boards are selected for use according to their type, size, thickeners and edge profit. The Boards may be used for example to provided dry lining finishes to masonry walls, to ceilings, to steel or timber framed partitions, or as claddings to structural steel columns and beams, or in the manufacture of pre-fabricated partition panels.

It consists of a core of aerated gypsum plaster bonded between two sheets of heavy-duty paper.

Cenosphere

The word Cenosphere is derived from two Greek words Kena (hollow) and Sphaira (sphere). Cenospheres are light weight, inert hollow sphere comprising largely of silica & alumina and filled with air or inert gas. Cenospheres are a naturally occurring by product of the burning process of pulverized coal-fired boilers. They are formed during the molten state of ash and attain spherical shape to have minimum surface tension. Cenospheres are formed from coal combustion ash when it is in a molten state. Flowing with the combustion gas stream, the temperature of the molten particles is rapidly quenched, thereby 'freezing in' a spherical shape. Any gas bubbles within the molten particles are also trapped inside the spheres.

Natural Rubber Block

Natural rubber, also called by other names of India rubber, latex, Amazonian rubber, gauchou or caoutchouc, as initially produced, consists of polymers of the organic compound isoprene, with minor impurities of other organic compounds, plus water. Thailand and Indonesia are two of the leading rubber producers. Natural rubber is used extensively in many applications and products, either alone or in combination with other materials. In most of its useful forms, it has a large stretch ratio and high resilience, and is extremely waterproof. Latex is the polymer cis-1,4-polyisoprene – with a molecular weight of 100,000 to 1,000,000 daltons.

Natural rubber is an elastomeric and a thermoplastic. Once the rubber is vulcanized, it is a thermos. Most rubber in everyday use is vulcanized to a point where it shares properties of both; i.e., if it is heated and cooled, it is degraded but not destroyed.

India's natural rubber imports in 2018/19 surged to a record high as production dropped amid a rise in consumption, the state-run Rubber Board said on May 3. The country's production fell 7.5 percent from a year ago to 642,000 tones, while consumption jumped 9 percent to a record 1.21 million tones, the board said.

The world production of rubber was considered to be very unstable during the last few years. Comparatively,

India's production of rubber is consistent at the rate of 6% per annum. The Rubber industry in India is growing with its roots deeper. India is the 3rd largest consumer, while the largest producer of natural rubber in the world. The Rubber Board has received approval to encourage block rubber production, which is expected to mark a new channel for rubber processing in the domestic sector.

Chlorinated Paraffin Wax (CPW)

The Chlorinated Paraffins (CP) sector is major consumer of chlorine and about 12% of chlorine produced in the country is consumed by this unit. Chlorinated paraffins belong to a group of Chlorinated Hydrocarbons of straight chain lengths [C_nH_{2n+2}], where Carbon can be from C10 onwards. Generally, the paraffins used in manufacture of chlorinated paraffins are of C10 to C24 which corresponds to Normal and Heavy Normal Paraffins and Waxes.

Chlorinated paraffin formulations are used in a wide range of industrial applications including flame retardants and plasticisers. The product functions as an additive in metal working fluids, sealants, paints and coatings. Chlorinated Paraffins Wax are straight-chain hydrocarbons that have been chlorinated. Chlorinated paraffins Wax are classified according to their carbon-chain length and percentage of chlorination, with carbon-chain lengths generally ranging from C10 to C30 and chlorination from approximately 35% to greater than 70% by weight.

The global chlorinated paraffin wax market has been segmented based on application and region. Based on application, the global chlorinated paraffin wax market has been divided into lubricating additives, plastic additives, rubber, paints, metal working fluids, and others (including adhesive & sealants and fabrics). Chlorinated Paraffin Market size was estimated over USD 1.6 billion in 2016 and the industry will grow by a CAGR more than 3% up to 2024.

Chlorinated paraffin wax possesses complex chemical structures that allow several positions for chlorine bond formation. Based on degree of chlorination, chlorinated paraffin wax can be divided into two classes: low chlorine content paraffin wax (less than 50% chlorination) and high chlorine content paraffin wax (more than 50% chlorination).

decomposes proteins at ordinary ambient temperatures and may cause severe chemical burns. Sodium hydroxide in solid form, also called caustic soda, is an inorganic chemical compound belonging to the strongest alkali. In solid form, it is a white substance with crystalline appearance (fakes). Sodium hydroxide is used in many industries in the manufacture of pulp and paper, textiles, drinking water, soaps and detergents, and as a drain cleaner.

Caustic soda Market, also known as sodium hydroxide, has the chemical formula of NaOH. Caustic soda is the co-product of chlorine production. It is a major building block in many industrial processes. The global caustic soda market is expected to register a remarkable CAGR of 5.92% during the forecast period, 2019–2027. The prime factor supporting the growth of the global caustic soda market is the growth of the alumina industry due to the increasing use of aluminium in the automotive industry as the manufacturers are increasingly using aluminium to reduce the overall weight of the vehicles to curb emissions.

The global caustic soda market has been segmented by type, application, and region. By type, the lye segment accounted for the largest share of 67% by value in 2018. The segment is expected to register a CAGR of over 4.5% during the forecast period, owing to its widely used application as a chemical.

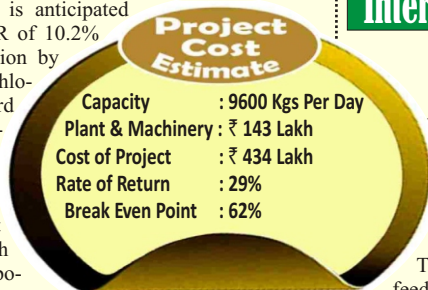

HDPE Pipes

HDPE pipes and fittings have a high degree of corrosion resistance, are light in weight. Yet tough and durable, have excellent, hydraulic properties, excellent thermal properties, weather ability. High density polyethylene (HDPE) is being used as drainage pipe material because it is lightweight, corrosion resistant, easy to install, and has a low maintenance cost. The design of HDPE corrugated drainage pipe is based on the assumption that the pipe will deform and thus relieve stress. Consequently, ductility is an essential parameter to accommodate allowable deflection during the pipe's service life.

These HDPE pipes and fittings have a high degree of corrosion resistance, are light in weight. Yet tough and durable, have excellent, hydraulic properties, excellent thermal properties, weather ability. HDPE pipe has been used for decades in non-potable water applications. In particular, HDPE pipes are often preferred for their welded joints. While special equipment is required to form the weld, welding eliminates the need for separate fittings, a common source of leaks and contaminant infiltration.

The India PVC Pipes Market size was valued at \$3,159 million in 2016 and is anticipated to expand at a CAGR of 10.2% to reach \$6,224 million by 2023. Polyvinyl chloride (PVC) is the third largest selling plastic commodity after polyethylene & polypropylene. Indian plastic pipe market looks attractive with opportunities in the potable water supply, wastewater supply, agriculture, and chemical sector. The Indian plastic pipe market is forecast to grow at a CAGR of 10.4% from 2016 to 2021. HDPE pipe, as well as film and blow moulding grades of desired specifications are produced at stand-alone units, while HDPE/linear low density PE (LLDPE) swing units produce other HDPE variety, according to producers.

Steel Shots & Grits

Steel shots and steel grits are used in both static & site blasting equipment, materials and abrasives used for surface preparation can be hazardous if used carelessly. Many natural regulations exists for those materials and abrasive that are considered to be hazardous during or after use (waste management), such as free silica or carcinogenic or toxic substances.

Steel Grits is fabricated by crushing hardened shot, screening the resulting media and tempering it to a desired hardness. It is used in coating and rust removal where speed of cleaning is serious & rough finish is acceptable. Steel grit's superior hardness and precise microstructure provides maximum durability and impact energy transfer. Highly demanding, aggressive applications are ideal for steel grit.

Steel abrasives are particles of steel with high carbon content that are utilized as abrasive and peening media. Steel abrasives are available in two types based on their shape; shots and grits. Steel shots are spherical grains of molten steel produced through a granulation (atomization) process in requisite sizes or hardness. The steel abrasives market is expected to grow at a good rate in the coming years. Rapid industrialization and expansion of automotive production are the key trends stoking market growth. To decrease environmental issues, leading manufacturers in the automobile sector are manufacturing low-weight products, which emit low carbon dioxide, which are economical and yet provide superior performance.

The Indian Steel Abrasives industry is catered to by a few large players and numerous smaller players that specialise in select products where imports from China cater to the lower end of the market. Due to the soft market conditions in many advanced economies, India is becoming a focus market for major global players resulting in intense competition.

Now, the synthesis of PLA polymers can be performed by direct poly-condensation of lactic acid as well as by ring-opening polymerization of lactide (LA), a cyclic dimer of lactic acid. While the former method needs severe conditions to obtain a high-molecular-weight polymer (high temperature of 180–200°C, low pressure as low as 5 mmHg and long reaction times), the latter method can afford a high-molecular-weight PLA with narrow molecular weight distribution at relatively mild reaction conditions (low temperature of 130°C and short reaction times).

Extraction of Essential Oil from Black Pepper

An essential oil is a concentrated hydrophobic liquid containing volatile aroma compounds from the plant. They are also known as aromatic oils, fragrant oils, steam volatile oils, ethereal oils, or simply as the "oil of" the plant material from which they were extracted, such as oil of black pepper. Essential oil is used in perfumery, aromatherapy, cosmetics, incense, medicine, household cleaning products and for flavoring food and drink. They are valuable commodities in the fragrance and food industries. Essential oils are usually colorless, particularly when fresh. Nevertheless, with age essential oil may oxidize which resulting the color becomes darker. Therefore, essential oil needs to be stored in a cool, dry place tightly stoppered and preferably full in amber glass containers.

The Indian spices market is pegged at Rs. 40, 000 crore annually, of which the branded segment makes up 15 per cent. The population in India is surging and the increasing consumer expenditure on food explains the swelling demand for food in India. Accordingly, the demand for spices is expected to grow in the future which will lead to a prominent growth in the revenues from the sales of spices in India. The revenues from India market are expected to expand to around USD 18 billion in FY'2020, growing with a

Dry Fruits Processing (for Snack, Almond, Pistachio and Cashew Nut)

Dried fruits are one of the most popular products made by small-scale processors. Drying removes the water from fruits so that the growth of micro-organisms is inhibited. It also reduces the weight and bulk of foods which cuts down on transport and storage costs. Walnuts, Cashew nuts, Almonds, pine nuts, Pistachio provided a high calorie intake. Nuts are used by mankind for food, edible oils, spices, condiments or beverages. Nuts are a rich source of protein, dietary fibre, vitamins and minerals. This makes them a popular snack which is both tasty and nutritious.

The nut and dried fruit industry in India is currently pegged at INR 15,000 crores (~ USD 2 billion) and is estimated to grow to INR 30,000 crores (~ USD 4 billion) by 2020, according to the Chairman of Royal Dried Fruits Range, a city-based dried fruits retailer. The demand for fertilisers is divisible into three nutrients: nitrogen (N), phosphates (P2O5) and potash (K). Potash is used in the mineral form and is mainly imported for India's fertiliser requirements. Some plants produce only nitrogenous fertilisers, a few phosphatic and others mixed. This makes India the third largest producer of chemical fertilizers in the world. There are in the country some 56 large fertilizer plants (29 producing urea, 21 producing DAP and complex fertilizers, 5 producing straight nitrogenous fertilizers), while the rest 9 units produce ammonium phosphate. Hot Melt Adhesives for Corrugation Board

A thermoplastic, polymer based adhesive which is applied in the molten state and which functions primarily by mechanical anchorage. We can define hot-melt adhesives as thermoplastic materials, solid at room temperature. When heated above their melting point, they become fluid and are able to wet the surfaces to which they are applied. Generally, a quantity of fluid hot melt is applied to one or both of the surfaces to be joined and the surfaces are brought together.

Hot Melt Adhesives be defined as adhesives that melt and flow on application of heat and solidifies on cooling to give a strong adhesion. The global market for hot melt adhesives is expected to reach 2, 379.9 Kilo tons by 2020, growing at an estimated CAGR of 5.1% from 2014 to 2020. The market size of all types of adhesives is very large and growing. Of this, the premium products account for some 45%. Quantitatively, the overall market size is growing annually at 11%.
