

Production of Urea Formaldehyde UF85

Description:

Production of Urea Formaldehyde UF85. Start Own Industry of Urea Formaldehyde.

UFC-85 is a viscous liquid containing 60% formaldehyde, 25% urea and balance water. Formaldehyde is first produced by the reaction of methanol with air. This is then absorbed in urea solution to form UFC-85.

Urea formaldehyde is the very common chemical and is mostly used because of its chemical properties. Examples are textiles, paper, foundry sand molds, wrinkle resistant fabrics, cotton blends, rayon, corduroy, etc. also used to glue wood together. Urea-formaldehyde (UF), also known as urea-methanal, so named for its common synthesis pathway and overall structure, is a non-transparent thermosetting resin or polymer. It is produced from urea and formaldehyde.
