

Production of Wood Fibers (Used in MDF).

Description:

Production of WoodFibers (Used in MDF). Investment Opportunities in Wood and Wood Based Products.

Wood fibers (also spelled wood fibers, seespelling differences) are usually cellulosic elements that are extracted from trees and used to make materials including paper. The end paper product (paper, paperboard, tissue, [cardboard](#), etc.) dictates the species, or species blend that is best suited to provide the desirable sheet characteristics, and also dictates the required fiber processing ([chemical](#) treatment, heat treatment, mechanical "brushing" or refining, etc.).

Wood fibers are made of cellulose got from the xylem vessels in plants, especially trees. Other plants providing fibers include straw, [bamboo](#), cotton, hemp, and sugar cane.
