

Power Cables, Electrical Power & Industrial Cable, Electrical Wire, PVC Wire and Cables Manufacturing Plant, Detailed Project Report, Profile, Business Plan, Industry Trends, Market Research, Survey, Manufacturing Process, Machinery, Raw Materials, Feasib

Description:

Electrical power cables used for transmission and distribution purposes consist of conductors stranded from plain high conductivity annealed copper wires insulated with oil impregnated paper tapes. Underground construction is necessitated in the more densely built up portions of cities by the heavy transformers and lines required and by the multiplication of service connections to buildings. The cable may include uninsulated conductors used for the circuit neutral or for ground (earth) connection.

Power cables are primarily used for overhead lines and underground cabling applications and can be broadly classified into three categories based on their operating voltage applications. The prospects for growth in this market will be impelled by the rising demand for high-temperature, superconducting cables from the power utility sector. A superconducting high-power transmission and distribution cable is capable of transmitting and distributing about 5-10 times the electrical current carried by a conventional copper or aluminum cable.
