

Soda Ash (Light & Soda Ash Dense) Production

Description:

Soda Ash (Light & Soda Ash Dense) Production. Sodium Carbonate Manufacturing Industry

The market of Soda Ash in India is anticipated to cross \$2.8 billion by the end of 2025.

Soda ash also known as sodium carbonate is an alkali chemical refined from trona ore. It is an odorless powder which is not toxic, flammable, and explosive. Soda ash is available in three different grades namely dense soda ash, light soda ash, and washing soda. Dense soda ash is an anhydrous substance mostly used in the manufacturing of industrial chemicals.

Light soda ash is used as pH regulator in various industrial processes. Washing soda is an anhydrous substance that is produced combining light soda with additional molecules of water and used in soaps and washing detergents to improve their cleaning properties.

Sodium carbonate is used in the production of high performance powder detergents for laundry and dish washing. Sodium carbonate is a very efficient source of alkalinity reserve and plays an important role in water softening. As a result it has been approved by many detergent producers in nil-phosphate containing formulations. It may also be used for the direct soaking of clothes, dishwashing, floor washing and for degreasing operations.
