Formula and Manufacture of Polishes (Floor Polish, Oil Polish, Metal Polish, Furniture Polish, Leather Polish, Shoe Polish, Automobile Polish, Aluminum Polish, Glass Polish)

Description:

Polishing is theprocess of creating a smooth and shiny surface by rubbing it or using achemical action, leaving a surface with a significant specular reflection(still limited by the index of refraction of the material according to theFresnel equations.) In some materials (such as metals, glasses, black ortransparent stones) polishing is also able to reduce diffuse reflection tominimal values. When an unpolished surface is magnified thousands of times, itusually looks like mountains and valleys. By repeated abrasion, those"mountains" are worn down until they are flat or just small"hills." The process of polishing with abrasives starts with coarseones and graduates to fine ones.

There are various types of polishes havingindustrial and domestic applications; abrasive polish, aluminium polish, motorcar polishes, cellulose friction polishes, furniture polishes, leather beltpolishes, pine oil metal polish etc. Polishes in India grew by 7% in currentretail value terms in 2015 due to similar growth in shoe polish, whichrepresented 41% of total polishes value sales in the year. People having lesstime to polish shoes by themselves and the higher number of other shoe careproducts, such as sprays, caused the 7% sales rise in 2015, which was less thanthe growth rate averaged in the overall review period.
