

Abrasive, Asbestos, Cement, Refractory Products, Manufacturing Plant, Detailed Project Report, Profile, Business Plan, Industry Trends, Market Research, Survey, Manufacturing Process, Machinery, Raw Materials, Feasibility Study, Investment Opportunities,

Description:

Abrasive

An abrasive is a material, often a mineral that is used to shape or finish a work piece through rubbing which leads to part of the work piece being worn away by friction. While finishing a material often means polishing it to gain a smooth, reflective surface, the process can also involve roughening as in satin, matte or beaded finishes.

Asbestos

The asbestos cement industry is concerned with the production of various kinds of roofing, wall, and facing sheet materials; pressure and nonpressure pipes; electrical insulation boards; building details; structural components; and other products made from a base of asbestos and cement.

Cement

India is the second largest producer of cement in the world. No wonder, India's cement industry is a vital part of its economy, providing employment to more than a million people, directly or indirectly. India has a lot of potential for development in the infrastructure and construction sector and the cement sector is expected to largely benefit from it.

Refractory Products

Refractory materials are used to provide refractory lining in furnaces, kilns, incinerators, and reactors. These materials have a high melting point (greater than 1,520 degree Celsius). Refractory materials are subjected to various conditions such as high temperature, abrasions and chemical corruptions, slag attacks, and chemical reactions when they are used in refractory linings.
