

# Hot Melt Adhesives (HMA) Manufacturing for Book Binding, Packaging and Courier Bag

## Description:

**HotMelt Adhesives (HMA) Manufacturing for Book Binding, Packaging and Courier Bag. Profitable Adhesives Production Business Ideas for Entrepreneurs.**

[Hot melt adhesive](#) (HMA), also referred to as hotglue, may be a variety of thermoplastic adhesive that's commonly sold as solid cylindrical sticks of varied diameters designed to be applied using a hot gluegun. The gun uses a continuous-duty component to melt the plastic glue, which the user pushes through the gun either with a mechanical trigger mechanism on the gun, or with direct finger pressure. The glue squeezed out of the heated nozzle is initially hot enough to burn and even blister skin. The glue is tacky when hot, and solidifies during a few seconds to at least one minute. Hot melt adhesives also can be applied by dipping or spraying, and are popular with hobbyists and crafters both for affixing and as an inexpensive alternative to resin casting.

In industrial use, hot melt adhesives provide several advantages over solvent-based adhesives. Volatile organic compounds are reduced or eliminated, and therefore the drying or curing step is eliminated. [Hot melt adhesives](#) have long time period and usually are often disposed of without special precautions. A number of the disadvantages involve thermal load of the substrate, limiting use to substrates not sensitive to higher temperatures, and loss of bond strength at high temperatures, up to complete melting of the adhesive. This will be reduced by using a reactive adhesive that after solidifying undergoes further curing e.g., by moisture (e.g., reactive urethanes and silicones), or is cured by ultraviolet radiation. Some HMAs might not be resistant to chemical attacks and weathering. HMAs don't lose thickness during solidifying; solvent-based adhesives may lose up to 50–70% of layer thickness during drying.
