

Business Opportunity in Production of Magnesium Powder from Dolomite Stone

Description:

Business Opportunity in Production of Magnesium Powder from Dolomite Stone

Magnesium (Mg) is a chemical element with the atomic number 12 and the symbol Mg. It's a solid, gleaming grey. Magnesium is the universe's ninth most abundant element. It is created by the sequential addition of three helium nuclei to a carbon nucleus in massive, ageing stars. Much of the magnesium in such stars is ejected into the interstellar medium when they explode as supernovas, where it may be recycled into new stars.
