

Edible Oil Refinery Plant

Description:

An [edible oil refinery](#) involves refining [soybean and palm oils](#) for edible use. Edible vegetable oils are used in a wide variety of applications, from cooking to biofuels, depending on their chemistry. These processes require specialized refinery equipment to process them into finished products that can be used commercially or sold on store shelves. For instance, while soybean oil can be used as a frying medium or blended with ethanol to produce biodiesel fuel, a different process must be applied to turn it into lecithin.
