

LPG Bottling Plant Detailed Project Report, Profile, Business Plan, Industry Trends, Market Research, Survey, Machinery, Raw Materials, Feasibility Study, Investment Opportunities, Cost and Revenue, Plant Economics, Working Capital Requirement, Plant Layo

Description:

Liquefied Petroleum Gas is a Propane/Butane mixture liquefied under normal ambient temperature and moderate pressures. It is a safe, clean burning, reliable, high calorific value fuel. In addition to its use as a domestic fuel, it is also widely used in industries, where there is a requirement of low sulphur content fuel and fine temperature controls. The Chemical composition of propane is C₃H₈ and butane, C₄H₁₀. Liquefied Petroleum Gas (LPG), popularly known as cooking gas, is a mixture of hydrocarbons which are gaseous at normal temperature, but can be liquefied at moderate pressure, and can be stored in cylinders as a liquid under pressure, and is drawn out and used as gas.

Applications:

- For industries today, quality, costs, efficiency, environment, heat controllability, among others, are major concerns when it comes to choosing the right fuel.
- LPG addresses all these making it the ideal fuel choice for a host of industrial and domestic applications.
- LPG is a pure, clean energy source which provides even and controllable heat. This makes it the ideal heat and power source for a wide range of industrial uses.
- Since LPG is almost free from sulphur, it can be used in sensitive situations such as chemical processes, etc.
- LPG is also used for space and process heating to power industrial ovens, kilns, furnaces, machinery and in food processing units.
