

Food Processing Industry - Fruits, Vegetables and Food Processing (Canned Rice)

Description:

Food Processing Industry - Fruits, Vegetables and Food Processing (Canned Rice, Rice Cakes, Egg, Rice Flour, Butter and Margarine, Carrot, Potato Cubes, Mango Pulp, Vegetables and Fruits, Biscuits, Potato Flour, Green Chillis, Corn Sugars, Alcohol from Corn, Barley, Oats, Rye, Breakfast Cereals)

Food processing is the transformation of raw ingredients into food, or of food into other forms. Food processing typically takes clean, harvested crops or butchered animal products and uses these to produce attractive, marketable and often long shelf-life food products. Benefits of food processing include toxin removal, preservation, easing marketing and distribution tasks, and increasing food consistency. In addition, it increases yearly availability of many foods, enables transportation of delicate perishable foods across long distances and makes many kinds of foods safe to eat by deactivating spoilage and pathogenic micro-organisms. Processed foods are usually less susceptible to early spoilage than fresh foods and are better suited for long distance transportation from the source to the consumer. The extremely varied modern diet is only truly possible on a wide scale because of food processing. Food Dehydration is a method of food preservation that works by removing water from the food, which inhibits the growth of microorganisms. The dehydration process has to check various parameters like heat-mass transfer, atmospheric pressure, equipments suitable for drying etc. to ensure suitable dehydration of food. Food processing techniques have to take measures on to maintain food safety and control risks and hazards associated with food processing.
