

Production of Mosquito Repellent Coil. Mosquito Repelling Incense Coils Manufacturing Project. Mosquito Coil Composition. Mosquito Repellent Industry

Description:

A mosquito coil essentially is an incense like the ones that are used in aromatherapy as well as in different religious rituals only this one is used for repelling mosquitoes.

Mosquito coils are burned indoors and outdoors in regions like Asia, Africa, and South America. Mosquito coils consist of an insecticide/repellent, organic fillers capable of burning with smoldering, binder, and additives such as synergists, dyes, and fungicide.

Mosquitoes need to be exterminated using with right tools and little bit of effort. Mosquito coil is mosquito-repelling incense, usually shaped into a spiral, and typically made from a dried paste of pyrethrum powder. The coil is usually held at the center of the spiral, suspending it in the air, or wedged by two pieces of fireproof nettings to allow continuous smoldering. Burning usually begins at the outer end of the spiral and progresses slowly toward the centre of the spiral, producing a mosquito-repellent smoke.

Insecticides are used either for killing or controlling of harmful insects. The insecticides which are applied for repelling insects are termed as "Repellent". Mosquito is one of the most harmful insects for mankind. To destroy them many preparations are available in the market in various recipes like pest killer spray, soap, oil, powder, repellent etc. Out of these, mosquito repellent is the most popular as it has germicidal and disinfectant properties and is able to repel mosquitoes and is convenient to use.

Mosquito coil is used for repelling and killing of household insects like mosquitoes, flies and garden insects. Because of the pyrethrin contained in it, the mosquitoes usually die in its vicinity.

Now-a-days repellents are applied by heating impregnated mat over an electrical device, under low temperature which is known as mosquito repellent mats. Simple type of repellent mats is prepared by soaking mats of paper pulp in repellent chemical compound and proper drying.

The automatic mosquito coil-manufacturing machine has materialized mass production by getting rid of various restrictions in manufacture. Synthesized pyrethrin, on the other hand, has enabled production of the material of the coils freely while pyrethrum had a limitation in its harvest.
