

Medium Density Fiberboard (MDF) - Market Survey cum Detailed Techno Economic Feasibility Project Report

Description:

Medium density fiberboard (MDF) is a generic term for a panel primarily composed of lignocellulosic fibers combined with a synthetic resin or other suitable bonding system and bonded together under heat and pressure. MDF is a wood based composite. The primary constituent is a softwood that has been broken down into wood fibres; that is the very cells (tracheids, vessels, fibres and fibre-tracheids), which are far smaller entities than those used in particleboard. The panels are compressed to a density of 0.50 to 0.80 and specific gravity (31-50 lb/ft³). Additives may be introduced during manufacturing to improve certain properties.
