

Wood Pellets Production from Sawdust

Description:

Wood Pellets Production from Sawdust. Earn Money from Wood Waste (Sawdust). Turning Sawdust into Briquettes.

Wood pellets, known for generating low emission and high power is gaining attention as an alternative to fossil fuels. Consumption of wood pellets for heating and power generation offers great advantages over burning fossil fuels, including renewability, low requirement of work input, cheap operating costs, and less emission of harmful substances.

Based on feedstock, the Wood Pellets Market is segmented into forest residues, agricultural residues, and energy crops. On the basis of the type of pellet heating appliance, the market segmentation includes free standing pellet stoves, pellet stove inserts, and pellet boilers. According to the application, it is categorized into power generation in industries, co-firing in industries, heating in residential sites, and heating in commercial sites.

Wood pellets have emerged as a viable and promising renewable energy source replacing coal in various advanced regions such as North America and Europe. The market for these biomass gained traction since they are considered to have low carbon footprints. The use of wood pellets as fuels has gained adoption for heating homes and power boilers, especially in various countries of Europe. The easy availability of raw materials such as timber and compacted sawdust and the low cost of production are key factors offering robust impetus to the wood pellets market. The mounting environmental concern about greenhouse gas emissions (GHGs) in countries such as the U.S., Canada, and Russia has made biomass fuels popular. In recent years, considerable progress made in logistics and advancement in combustion technology have boosted the wood pellets market.
