

Blending and Bottling of Thinners and Solvent Thinners

Description:

Blending and Bottling of Thinners and Solvent Thinners. Production of Paint Thinners and Solvents

A paint thinner is a solvent used to reduce thickness of oil-based paints or clean up after their use. They can also be used to remove tar buildup and other compounds.

The thinner has the ability to reduce all coatings that use conventional high VOC thinners. Normally paint thinner is used to remove oil-based paint from brushes, rollers, equipment, and surfaces. However, there are many other applications and uses for paint thinner saving you money and time.

Paint thinner is one of the most common industrial chemicals, and it's also one of the most versatile. In addition to thinning paint products for use and for cleanup, paint thinner is excellent for other industrial cleaning applications — removing stains, grease and more from certain surfaces.

Solvent, Substance, ordinarily a liquid, in which other materials dissolve to form a solution. Polar solvents (e.g., water) favour formation of ions; nonpolar ones (e.g., hydrocarbons) do not. Solvents may be predominantly acidic, predominantly basic, amphoteric (both), or aprotic (neither). Organic compounds used as solvents include aromatic compounds and other hydrocarbons, alcohols, esters, ethers, ketones, amines, and nitrated and halogenated hydrocarbons. Their chief uses are as media for chemical syntheses, as industrial cleaners, in extractive processes, in pharmaceuticals, in inks, and in paints, varnishes, and lacquers.
