Rubber Powder from Waste Tyres - Manufacturing Plant, Detailed Project Report, Profile, Business plan, Industry Trends, Market research, survey, Manufacturing Process, Machinery, Raw Materials, Feasibility study, Investment opportunities, Cost and Revenue

Description:

Rubberis polymer of butadiene and one of the most important chemical ingredients,which is widely used in the different field of modern advance world. Rubber isspecially used in the tyre Industry, which is used in the different type ofvehicles. Rubber products require rubber as a raw material. Either naturalrubber, which is often cultivated on large plantations – with all the problemsassociated with a monoculture or alternatively synthetic rubber, which isproduced using crude oil. Both processes use a high amount of resources. At theend of the chain, mountains of used car tyres crop up on the landscape. Thesewaste sites are taken on by used tyre and rubber recycling plants nowadays.

Wastetyre recycling technology is very cost effective and performs 100% wastage tyrerecycling (No churn left after the process). In this process no chemicalingredients are used, therefore it is environment friendly. Raw material(wastage tyre) is cheap and easily available, Generate economically valuableproducts out of waste tyres and products have good market value and demand.Also each recycled ton of tyres preserves 10 tons of carbon dioxide (CO_2) thatis a major green house gas.
