

Profitable Business Ideas that'll make you Millionaire

Description:

Profitable Business Ideas that'll make you Millionaire. List of Businesses with huge Profits

Anhydrous Ferric Chloride

Iron (III) chloride (Ferric Chloride, FeCl_3) has been used in the synthesis of Au/Fe nanoparticles. It has been used as oxidative etching agent during the preparation of platinum nanostructures. Iron (III) chloride, also called ferric chloride, is an industrial scale commodity chemical compound, with the formula FeCl_3 and with iron in the +3 oxidation state.

The colour of iron (III) chloride crystals depends on the viewing angle: by reflected light the crystals appear dark green, but by transmitted light they appear purple-red. Anhydrous iron (III) chloride is deliquescent, forming hydrated hydrogen chloride mists in moist air. It is rarely observed in its natural form, the mineral molysite, known mainly from some fumaroles.

Ferric chloride is a brownish liquid which has a pungent odor which is similar to that of hydrochloric acid. It also exists in solid lump form or in anhydrous powder form. Ferric Chloride or Iron (III) Chloride is used as a floccing agent in drinking water and waste water treatment in various industries.
